

\

During this sprint there was a slight hiccup as one of our group members decided to drop the course. As a result our group suffered a heavier workload and our backend features took longer to complete. The chart shows the scope changing on the last day (Mar 17th). A feature that had a subtask assigned to the dropped member was not finished hence it was replaced with a different one. In comparison with last sprint's burndown chart there's an improvement on Jira usage and not completing issues on the last day. However, there's room for better improvement to resemble closer to the guideline which we hope to achieve in our next sprint.
